Urban small-water bodies (artificial, modified, restored) as aquatic nature-based solutions (aquaNbS) for water regulation (buffering and infiltration of runoff), recreational use, or aesthetic enhancements

SET research framing for aquaNBS

Social	Ecological	Technological
<p>Is there a room for biodiversity in climate policies supporting NBS? What is the role of biodiversity in planning and maintaining aquaNBS?</p>	<p>What drivers and interlinkages there are between environmental factors and biodiversity? What kind of species richness and composition there are in aquaNBS?</p>	<p>How does surrounding built environment influence biodiversity and ecological quality of aquaNBS?</p>

Main SET stressors for aquaNbS

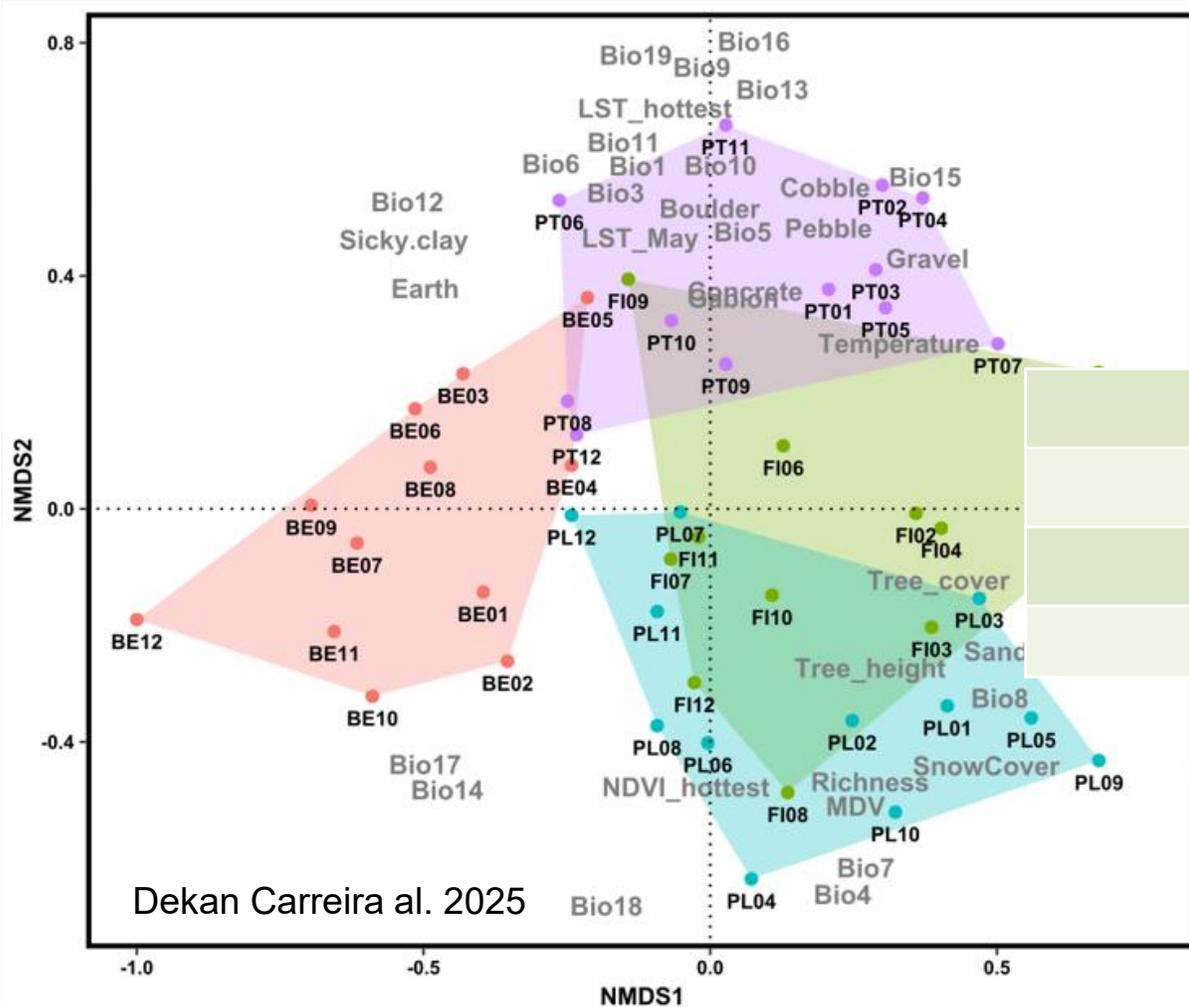

- There is a need to monitor effectiveness and sustainability of aquaNbS to ensure delivering benefits for nature and society
- We found integrated (*isotopes, eDNA, macrophytes*) evaluation method useful to detect ecological functions of urban aquaNbS
- Lack of natural substrates, suitable plant beds and the presence of steep concrete shorelines can limit diversity of aquatic species
- The high evaporative enrichment found in isotope analyses suggests a certain sensitivity to hydroclimate

Due to staff change and low commitment, we partly failed to collect required data in all five cities (missing data from Finland and Germany)

Wartet al. 2025; Szoszkiewicz et al. 2025

Main SET drivers of macroinvertebrate communities

NbS characteristics

- type of habitat (stream vs pond)
- Water availability (permanent vs temporary)
- bottom material
- water depth

Climate

- Bioclimatic variables
- Snow cover, Land Surface Temperature

Water parameters

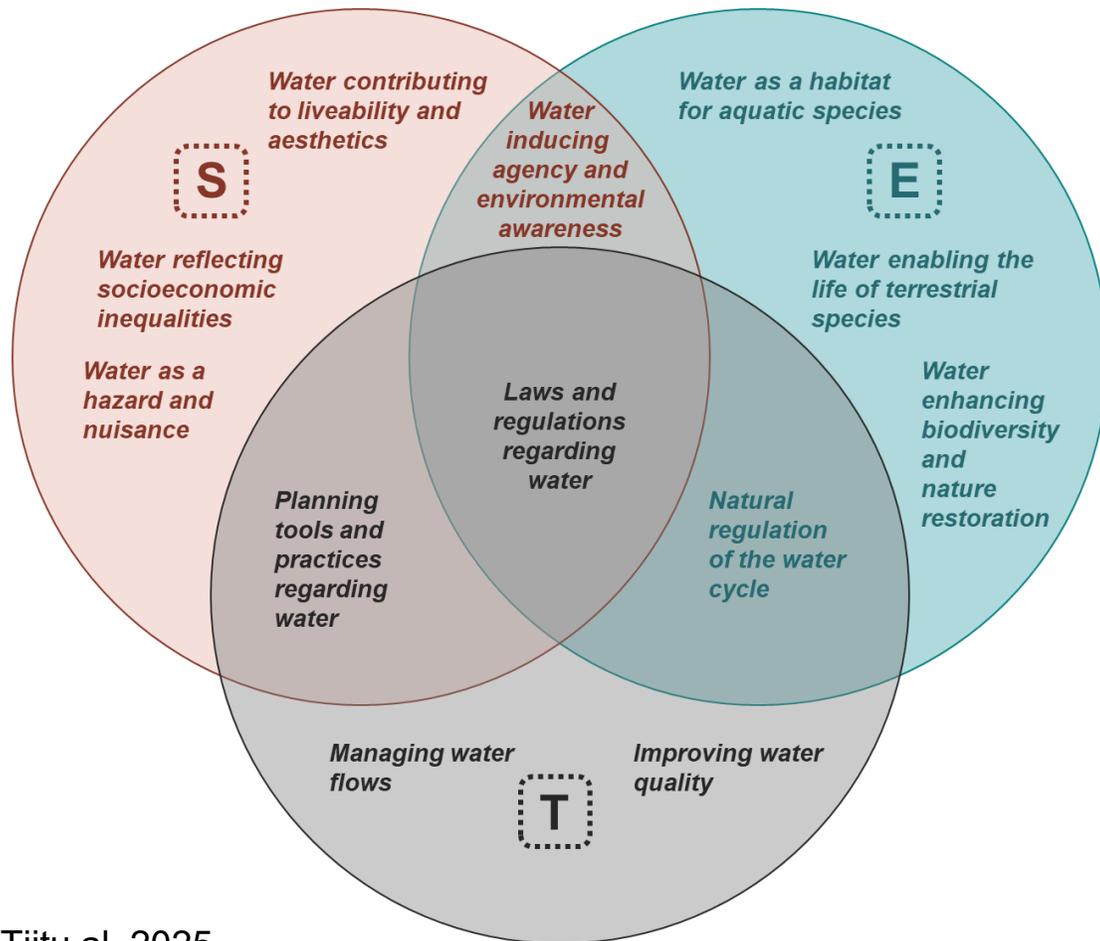

- d-excess (potential evaporative effect)
- water temperature, pH
- oxygen concentration, conductivity

Surrounding vegetation

- Global Normalized Vegetation Index (NDVI), tree height and tree cover

Selecting similar types of aquaNbS for analyses failed partly

Main SET drivers for planning and maintenance

- Using the SETS framework, we examined practitioners' conceptions of water in the context of aquaNbS in the Helsinki city region, Finland
- Analysis of the interview data revealed a dominance of technical (T) conceptions of water
- Increasing consideration of social (S) and ecological (E) conceptions of water likely requires a shift from viewing water infrastructures as conventional systems to sustainable systems

Group interviews were not completed in all five cities and there have been serious delay in processing comparative analyses

Tiitu al. 2025

Policy Impacts of BiNatUr

- Provided new **scientific evidence** on biodiversity and ecosystem services of aquaNBS in urban areas to support local planning, implementation and maintenance practices and
- To help urban planners, designers creating, maintaining and evaluating **biodiversity friendly aquaNbS** which are simultaneously effective in producing regulating ES
- Have raised **awareness of the role of biodiversity** in aquaNBS among planners but also among wider interested public through several local workshops, training sessions and field visits
- Developed standardized **monitoring and sampling methods** further use to better fit for urban small water bodies and small-scale aquaNbS

Tiitu al. 2025

Conclusions

- AquaNBS can support urban biodiversity and ecosystem services
- More strategic approach to aquaNbS planning and implementation in cities is needed
- Understanding which environmental factors impact species communities is critical to improve construction, restoration and management of aquaNbS and their biodiversity
- Take climate conditions into account - especially climate seasonality of drought and ice - important for management since extreme events increase due to climate change

COSAR

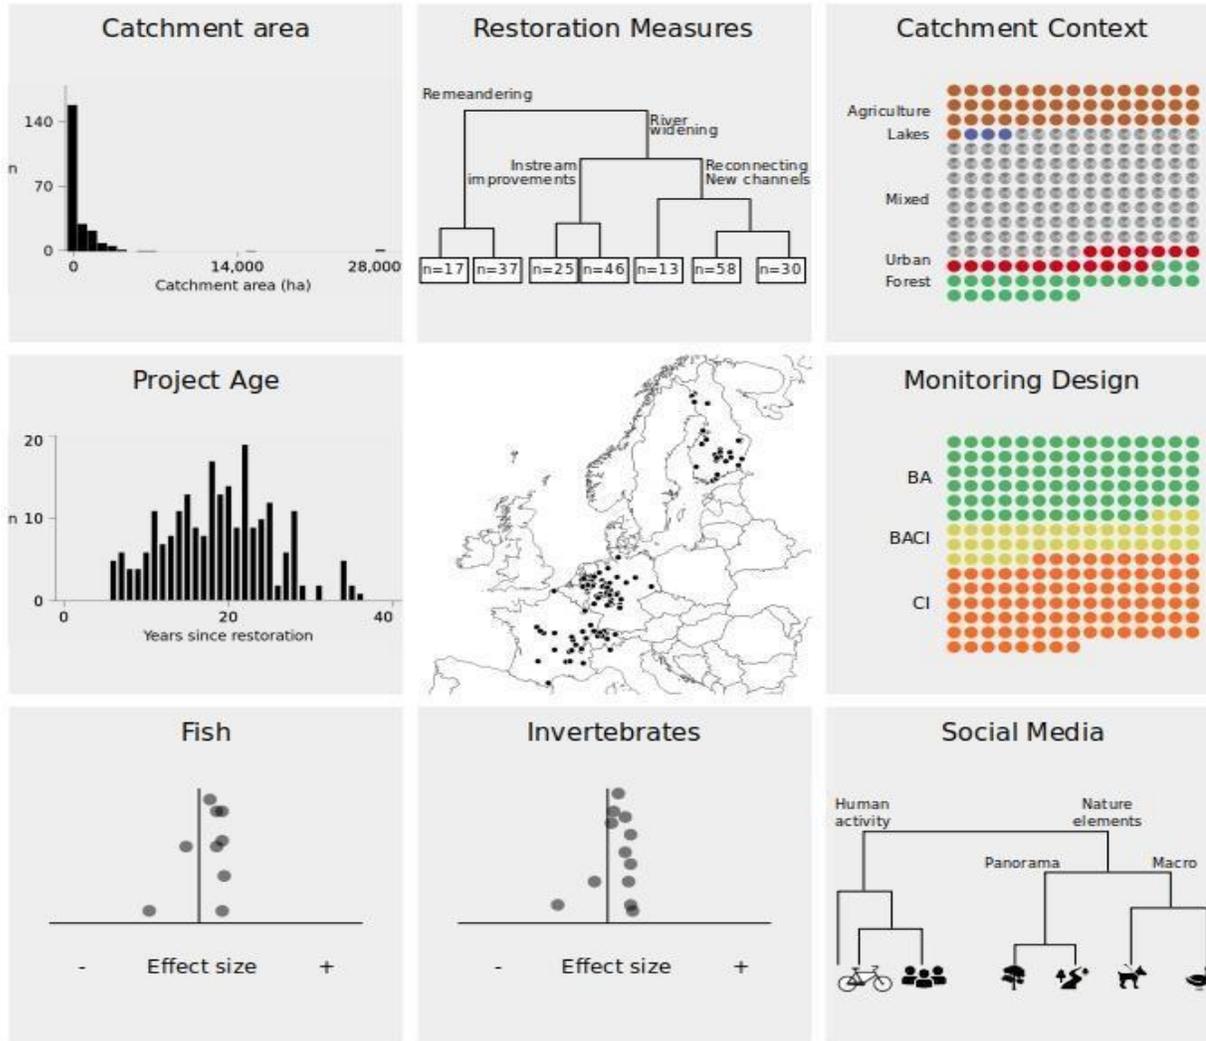

Context-dependence of the societal and ecological outcomes from river ecosystem restoration

By Jérémy Piffady

Consortium: Alienor Jeliaskov, Céline Le Pichon, Stefan Stoll, Evelyne Tales, Ralf Verdonschot, Christine Weber and Jérôme Belliard

and young researchers Blandine Charrat, Nina Kaiser, Martin Palt and Mathieu Floury

COSAR - Goals and challenges

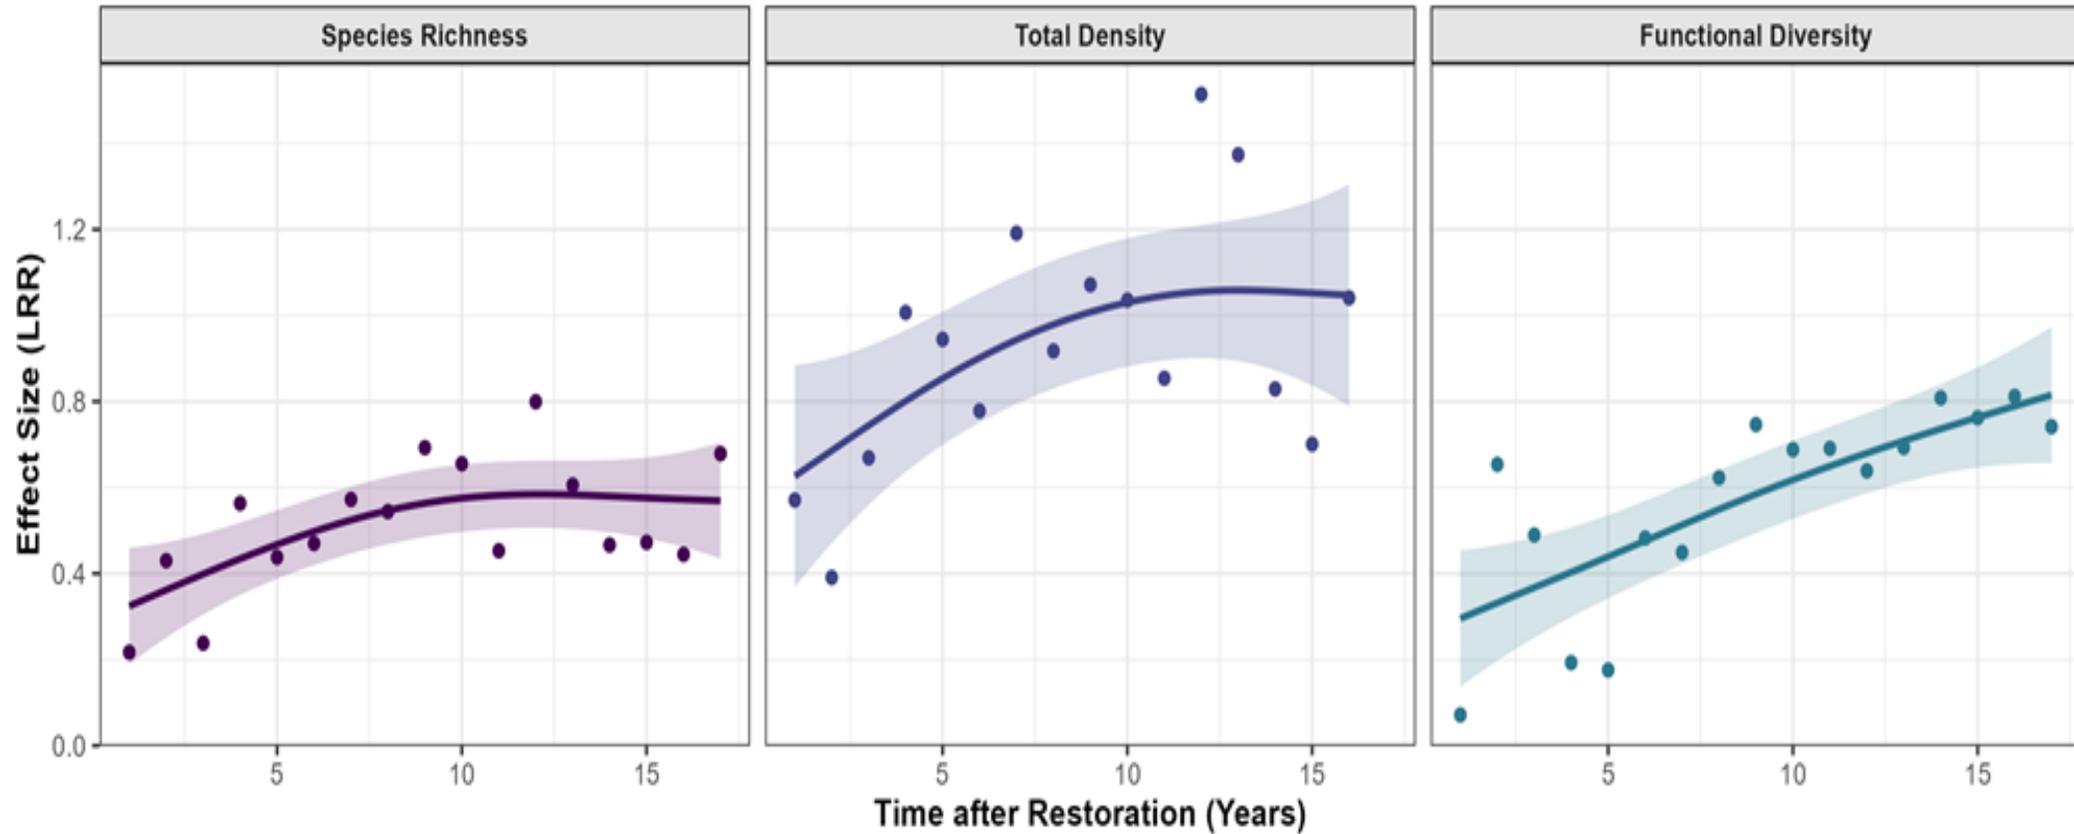

Goal: exploring the environmental context enhancing more positive ecological and societal outcomes from restoration of rivers

Harmonize a large dataset of 226 ecological survey sites

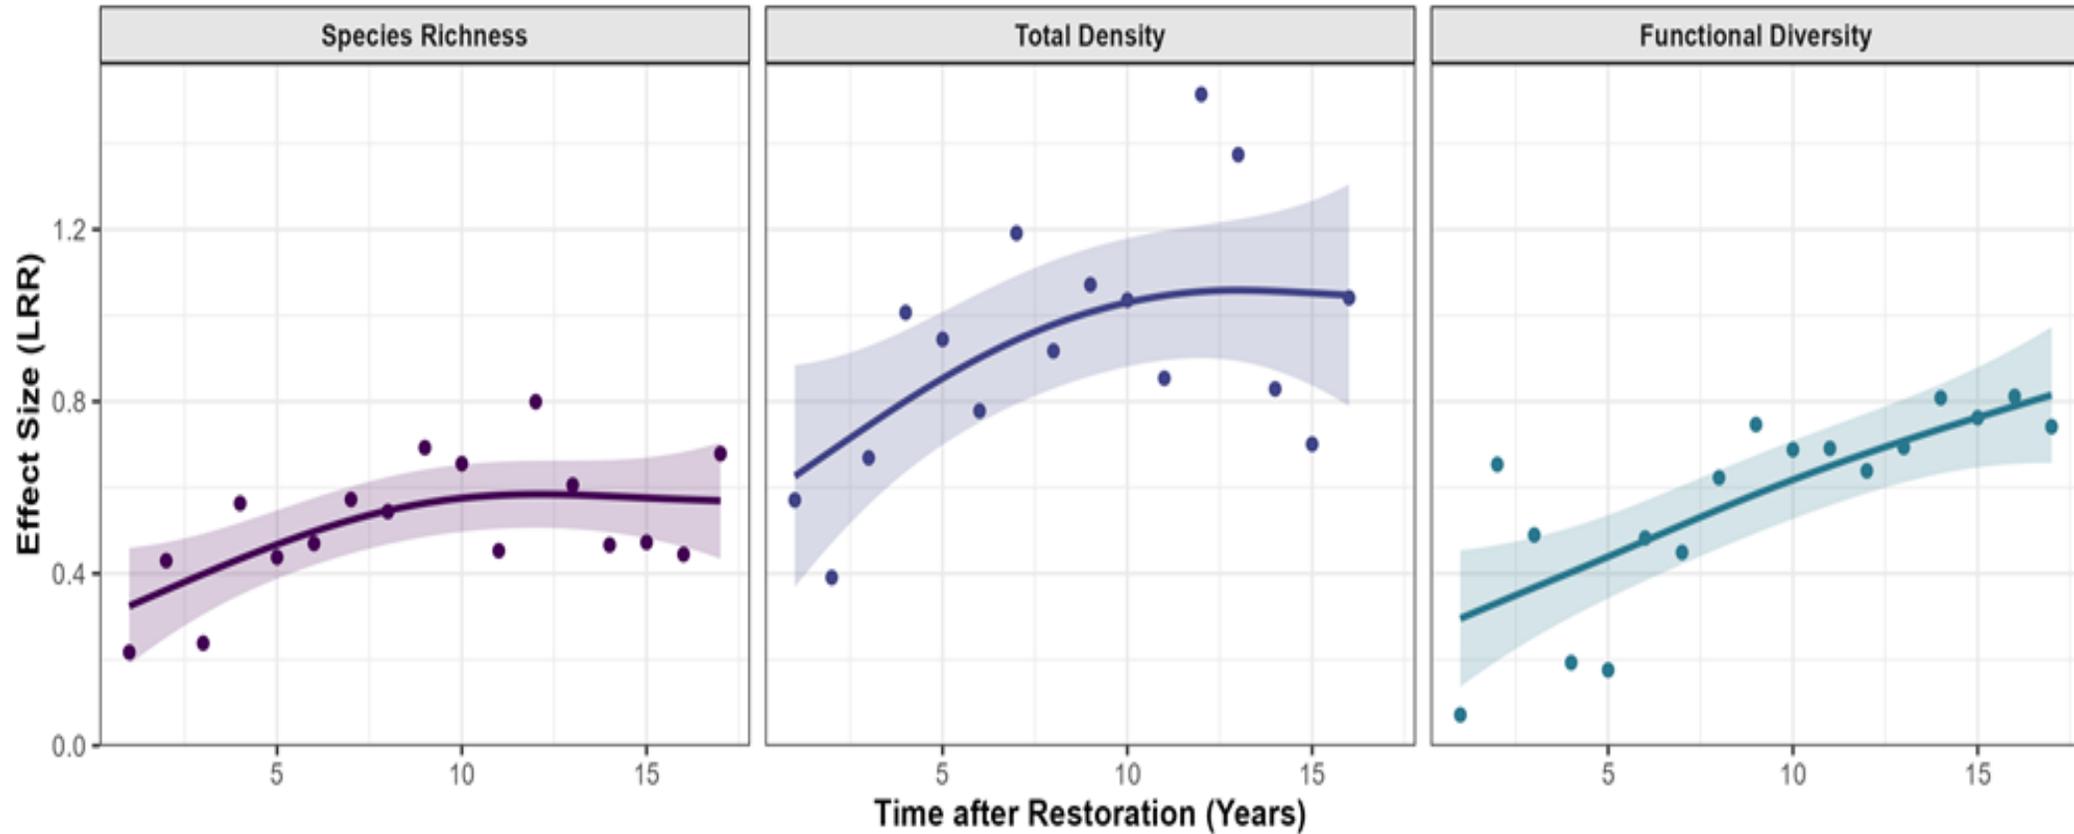

Use innovative approaches to extract information from social media networks

GIS / European data layers

Understanding ecological outcomes – the hard choice of metrics

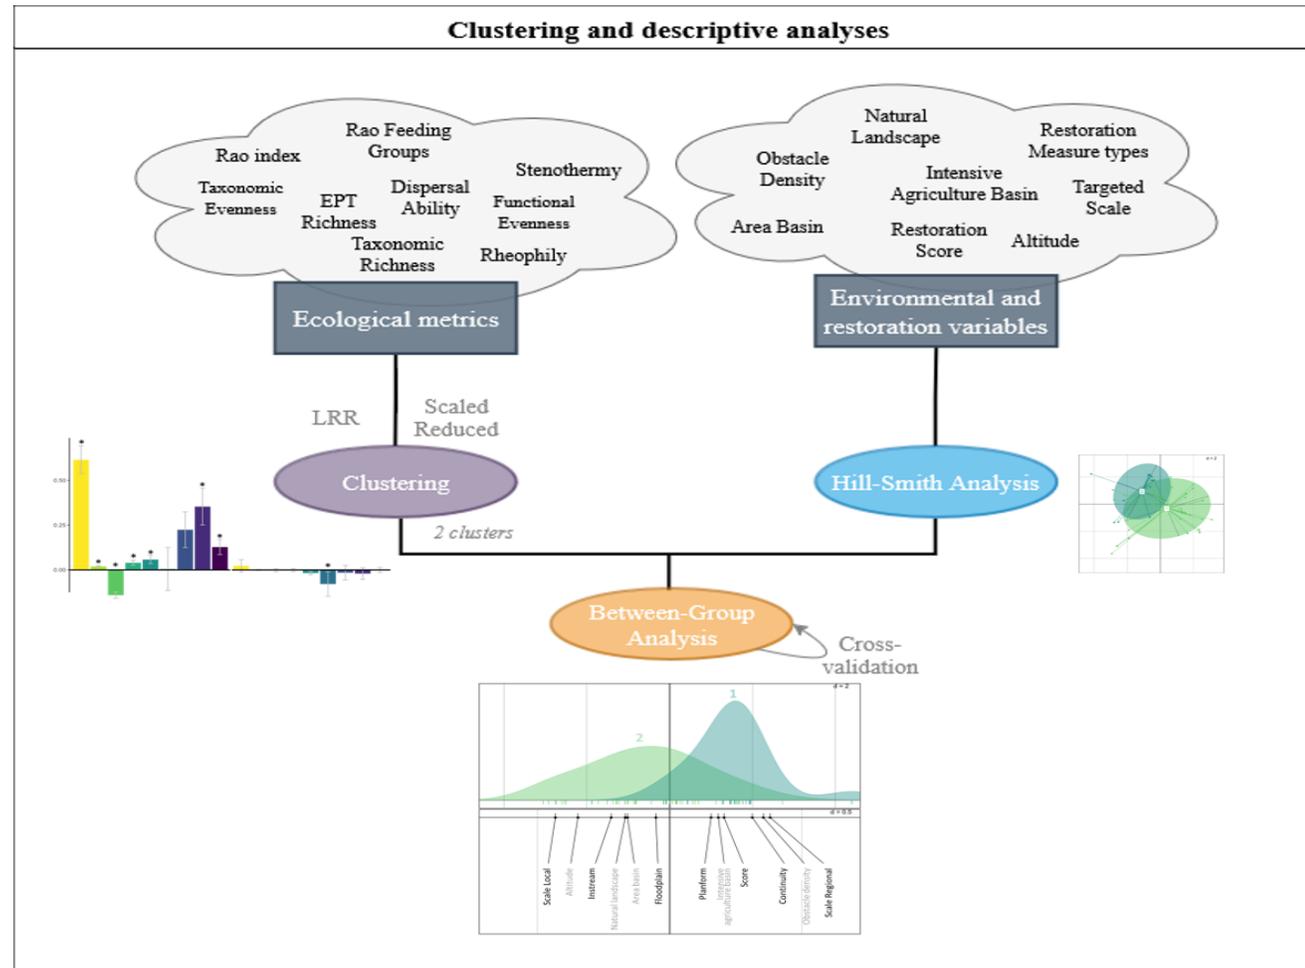

Understanding ecological outcomes – the hard choice of metrics

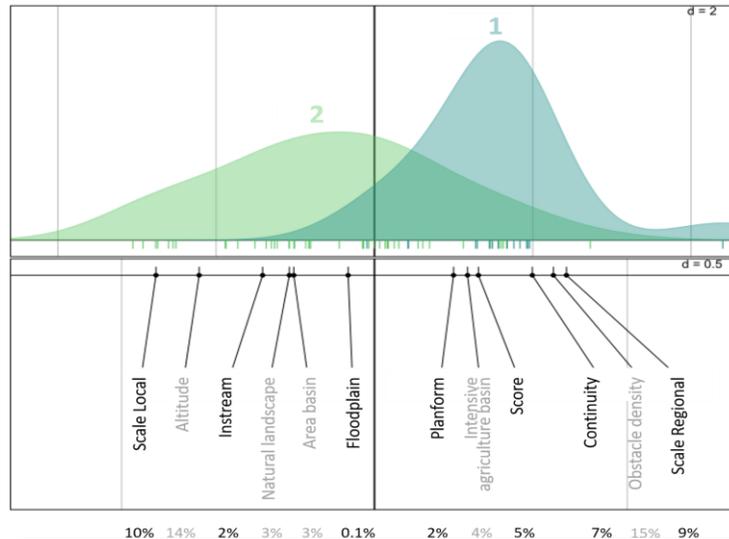

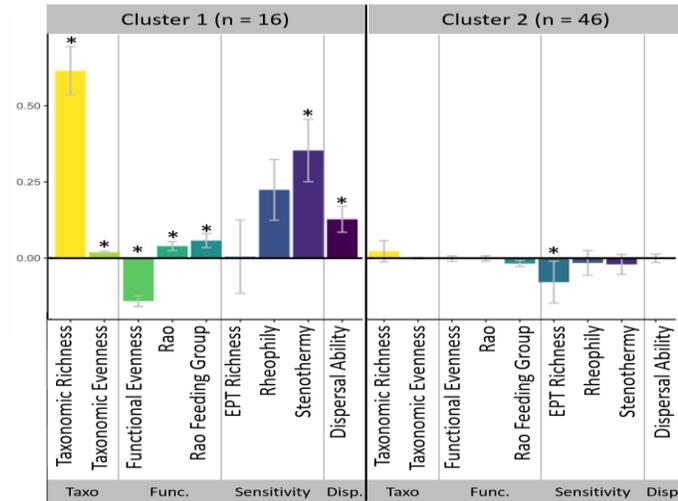

What if we tried to model different responses to environment all together?

Understanding ecological outcomes – towards integrative multi-metrics analysis

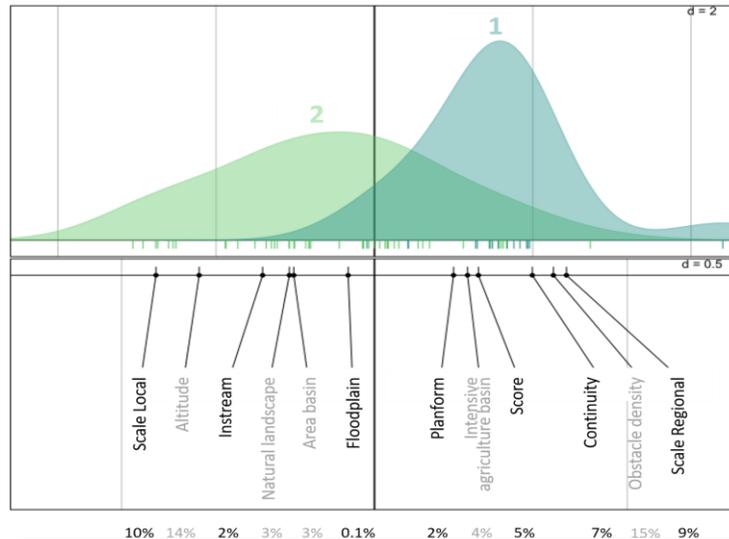

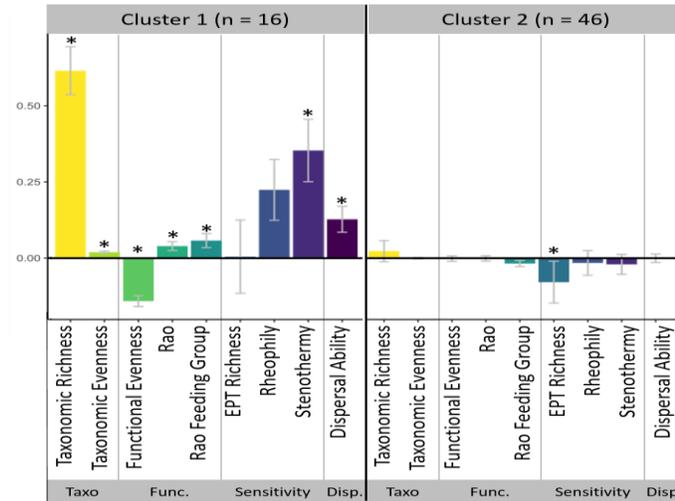

What if we tried to model different responses to environment all together?

Understanding ecological outcomes – towards integrative multi-metrics analysis

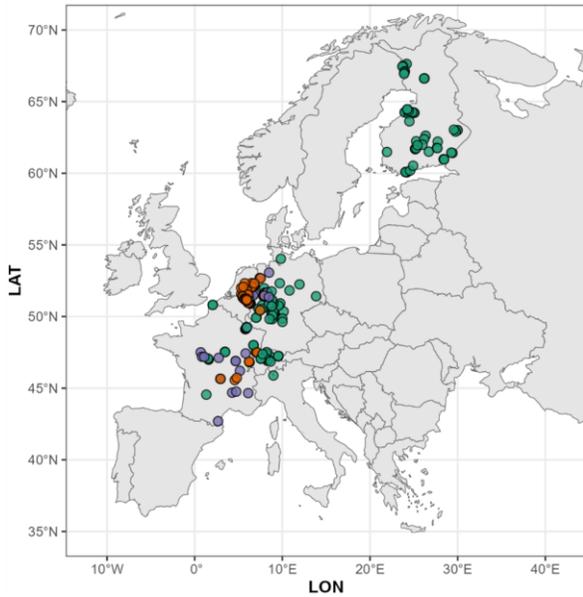

- Only 2 clusters
 - High + effects vs. No effect
 - Most of sites exhibit low effects
- Environmental factors
 - Larger effects in more degraded landscapes / large scale context
 - Larger scale projects, targetting processes and not local instream habitats

Understanding ecological outcomes – towards integrative multi-metrics analysis - Hurdles

- Effect-sizes allow large scale comparisons (sites, monitoring, metrics, biological compartments) but
- Hide the starting and final states
 - Large effects, but does it mean reaching a good state?
 - How to tackle this remaining uncertainty?
 - Need for case to case checking or develop new ways to introduce potential group baselines to allow more precise conclusions

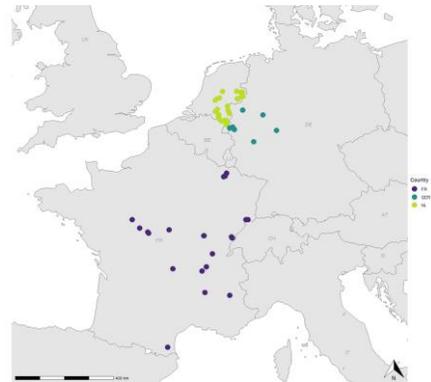

Understanding ecological outcomes – towards integrative multi-metrics analysis - Hurdles

From a 226 sites database

Group
● FISH
● INV
● BOTH

To a 62 sites analysis

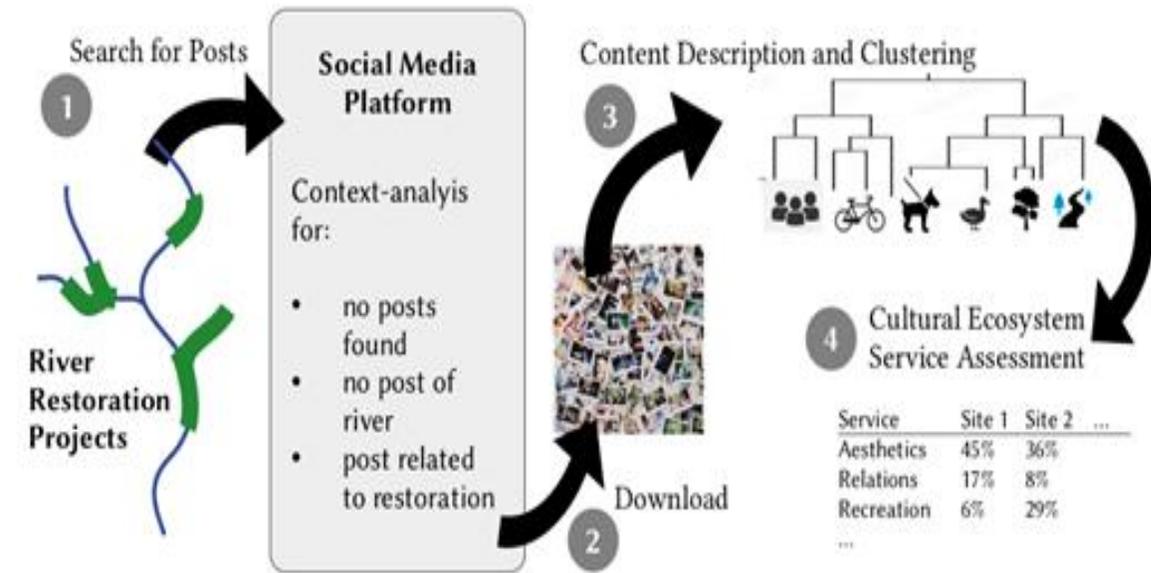

- Effect-sizes allow large scale comparisons (multiple countries, metrics, biological compartments) but
- Hide the starting and final states
- Difficult to disentangle the effects
 - Need larger datasets to get finer grain typical responses patterns
 - Need for harmonised ones

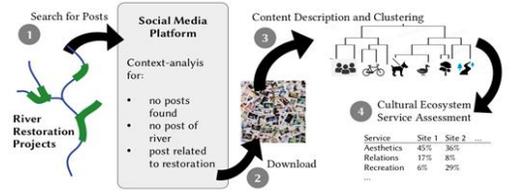

Understanding societal outcomes – Using social medias

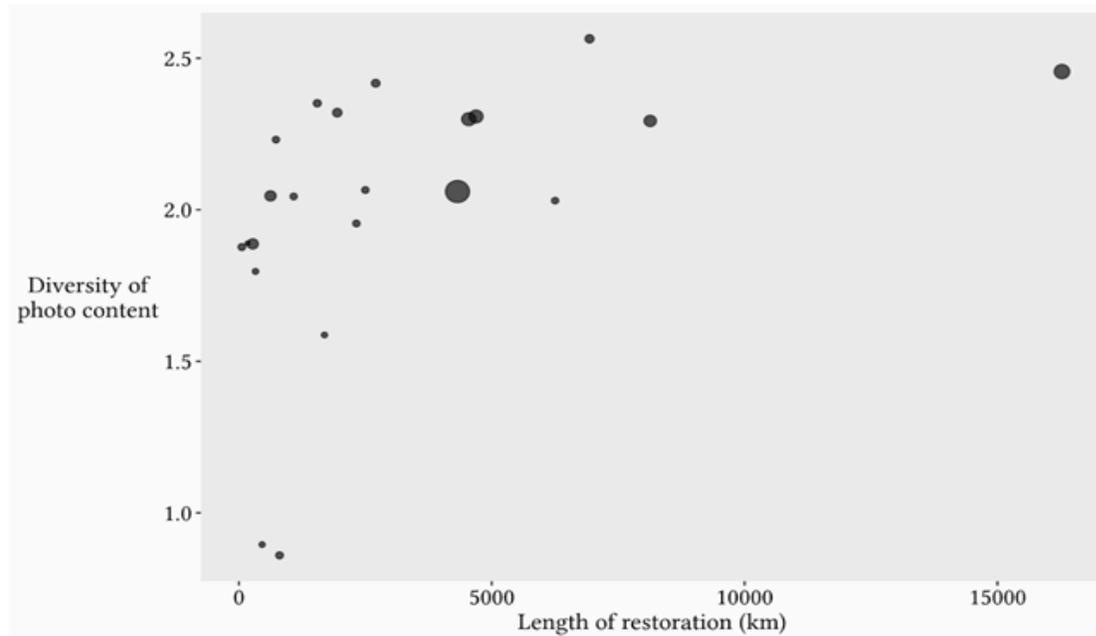

- Population reacts to restoration through social medias, making it possible to assess perception
- Opens paths for innovative indicators

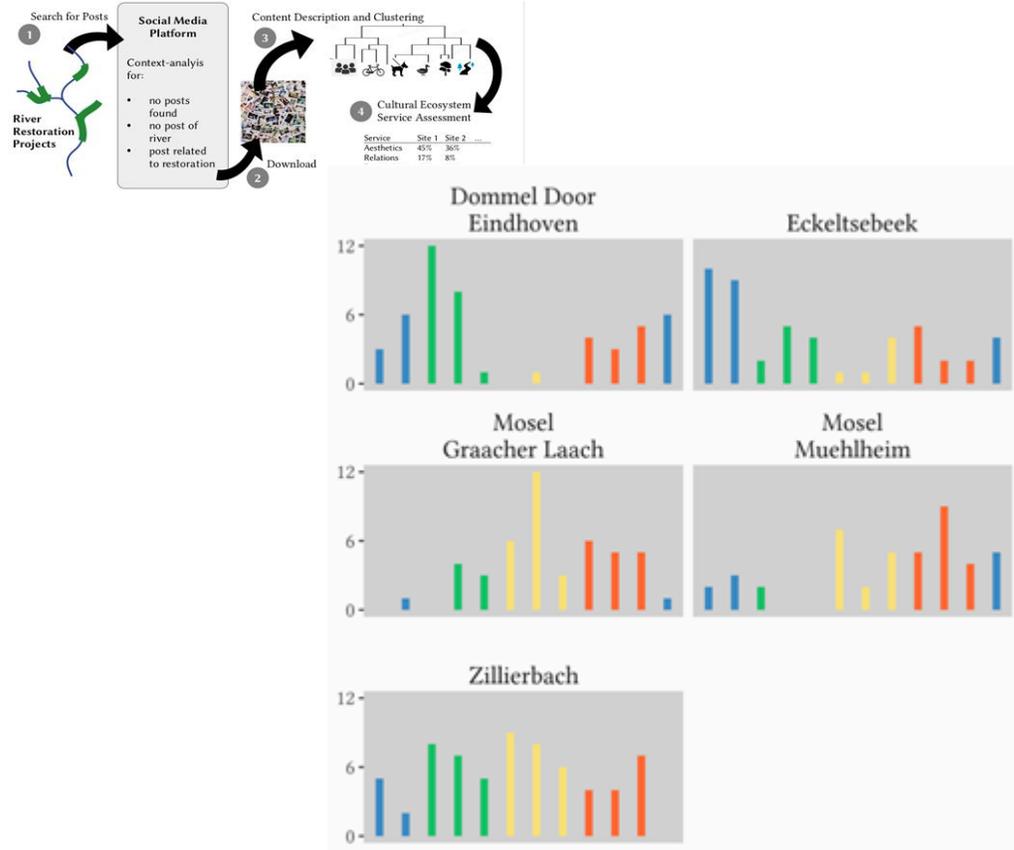

Understanding societal outcomes – Using social medias

- Population reacts to restoration through social medias, making it possible to assess perception
- Opens paths for innovative indicators
- Investigate Cultural Ecosystem Services
 - Larger projects generate more CES

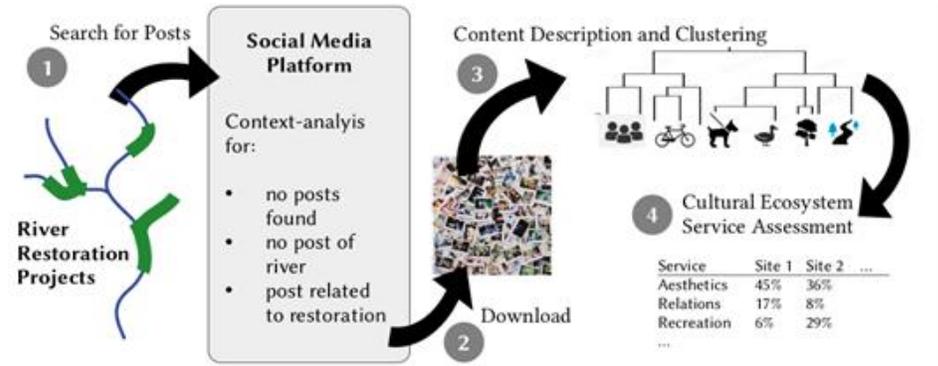

Understanding societal outcomes – Using social medias

- Population reacts to restoration through social medias, making it possible to assess perception
- Opens paths for innovative indicators

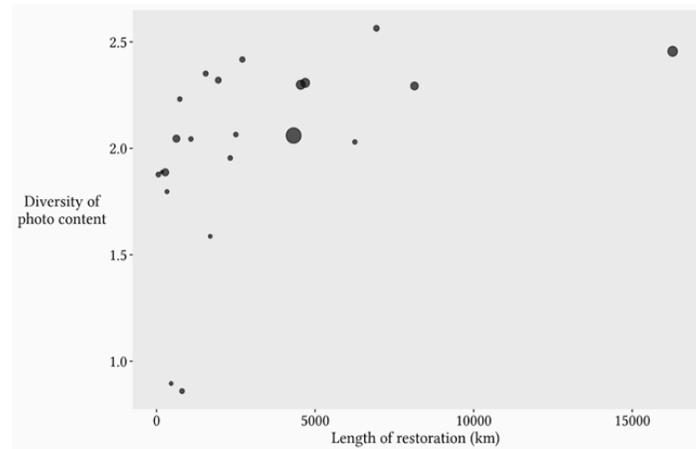

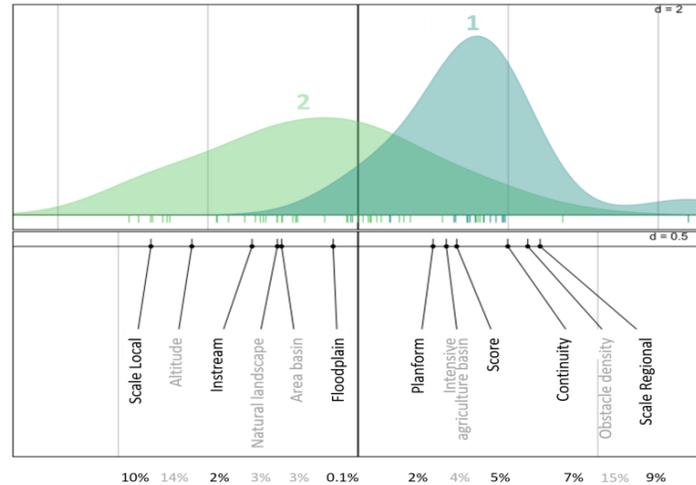

- Investigate Cultural Ecosystem Services
 - Larger projects generate more CES
 - Inter-seasonal patterns can be seen on individual sites

Understanding societal outcomes – hurdles

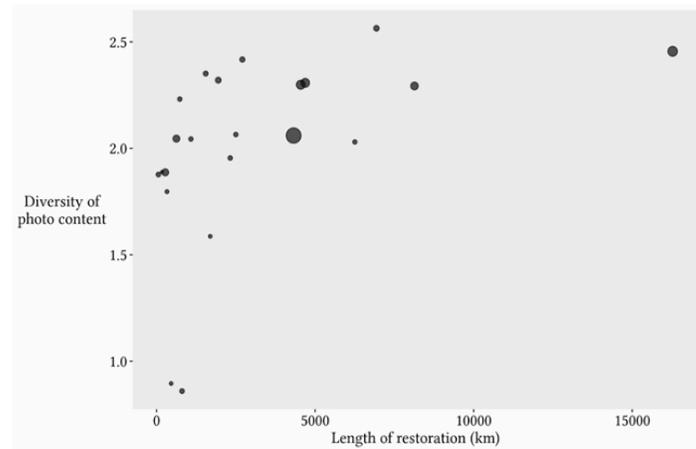

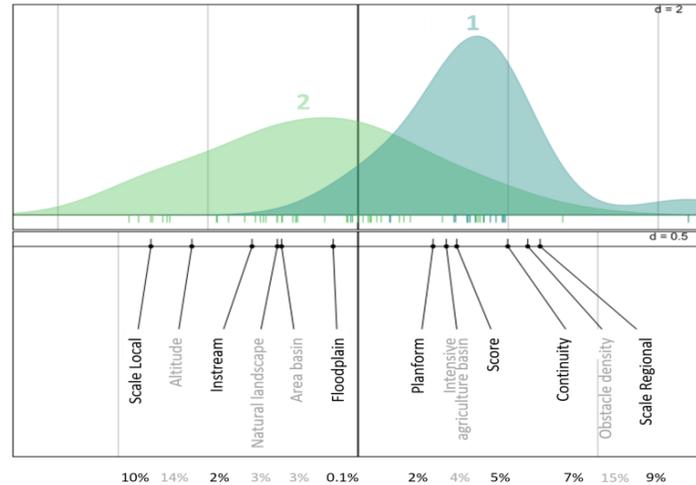

- Entire process takes long time
- Main social medias do not integrate precise location
 - Difficult to identify the available and relevant pictures
 - Work with hashtags
 - But this is possible to create dedicated hashtags

Policy impacts – take-home

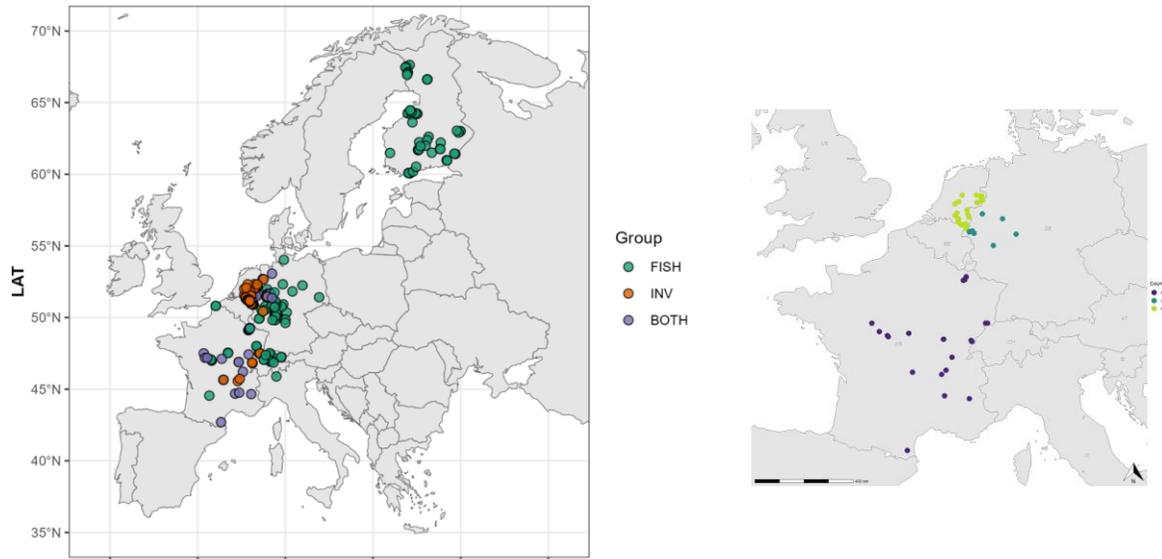

- Restoration has larger ecological and societal effects for larger projects, targetting processes and functions
 - Social media posts can be enhanced at local scale

Policy impacts – take-home

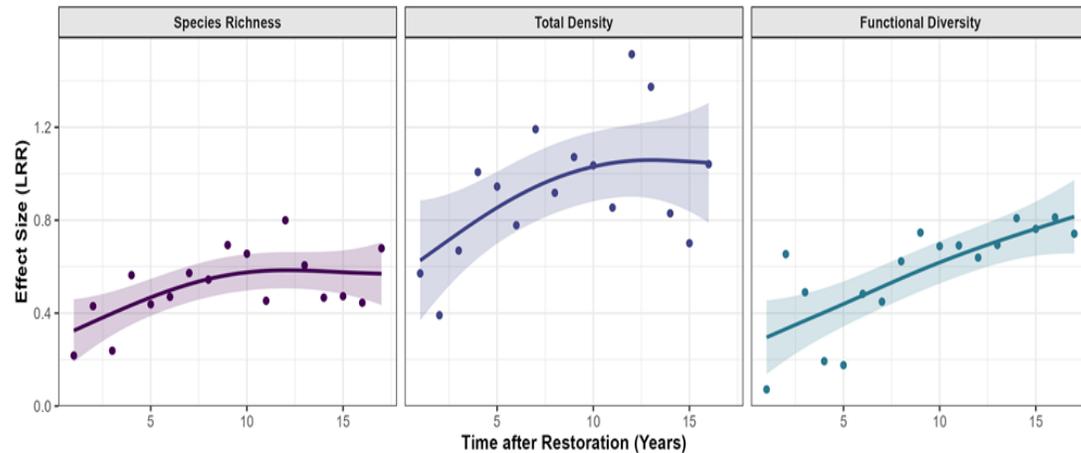

- Restoration has larger ecological and societal effects for larger projects, targetting processes and functions
- Ecological changes are higher in more degraded contexts
 - Still with the uncertainty : larger effect-size do not necessarily mean good final state

Policy impacts – take-home

- Restoration has larger ecological and societal effects for larger projects, targetting processes and functions
- Standardized monitoring would help increasing available sites for more robust large-scale analysis
 - Ecological systems need time to reach new equilibrium
 - Need long-term monitoring schemes

Policy advice

1. List, inform, enforce!
2. Valorize info outside of literature!
3. Consider re-introduction fairy shrimp and tadpole shrimp!

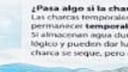

Tres cantos de anfibios

Charca del Parque Central

Proyecto impulsado en alianza entre la **Asesoría Técnica** y el **Ayuntamiento de Tres Cantos**, con el objetivo de conservar y poner en valor los **anfibios** y las **charcas temporales** del territorio municipal de Tres Cantos, amenazados por el cambio climático, las especies invasoras y la pérdida de hábitat. Incluye acciones de conservación como la creación y restauración de una red de charcas, seguimiento poblacional de anfibios o actividades divulgativas para generar concienciación en la población local y general.

10 motivos por los que conservar humedales y charcas temporales:

- Son hábitats de interés prioritario a nivel europeo.
- Albergan ciclos de vida completos y comunidades biológicas únicas.
- Son el único punto de reproducción posible para muchas especies.
- Conservan poblaciones de fauna y flora a través del tiempo.
- El agua mejora la productividad de los humedales.
- En España hemos perdido el 60% de los humedales en el último siglo.
- Más de la mitad de la fauna global vive asociada con charcas o humedales.
- Enriquecen y fertilizan el suelo.
- Favorecen la fijación de carbono y la regulación del cambio climático.
- Ayudan al bienestar: brindan servicios económicos y ecosistémicos irremplazables.

¿Pasa algo si la charca se seca?

Los humedales se pierden 3 veces más rápido que los bosques.

Si avanzamos agua durante más tiempo, se descomponen los ciclos vitales, pierden su valor ecológico y pueden dar lugar a proliferaciones no deseadas. Las especies están adaptadas a que la charca se seque, pero no a que sea permanente.

¿Qué puedo hacer para conservar las charcas?

Anfibios y reptiles	Insectos acuáticos	Crustáceos y leopoldópodos	Larvas	Algas y organismos sencillos

TRANSL C

Translocations of flora and fauna for conservation and restoration: ecological, evolutionary, and socio-economic impacts, at multiple scale

By François Sarrazin (MNHN SU)

& Carline Pitz (Uliège)

in the name of

9 Partners from 6 countries

2022-2025

➔ Development and enhancement of the TRANSLOC Database Major outcomes

The screenshot shows the TRANSLOC website interface. At the top, there is a navigation bar with links for HOME, Step-By-Step Guide, DATA, RESOURCES, ABOUT, Contact us, and Create user account. A 'Login' button is also present. The main content area is divided into two sections. The left section, titled 'WELCOME TO THE TRANSLOC WEBSITE!', contains a welcome message and a list of database details. The right section, titled 'TRANSLOCATED POPULATION MAP', displays a map of Europe and the Mediterranean region with numerous colored dots representing translocated populations. A legend indicates that dots of different sizes represent the number of populations (≤ 10 or > 10) and different colors represent taxonomic groups (Animalia, Plantae, Fungi). The website footer includes logos of various partner institutions and a Creative Commons license (CC-BY-4.0).

WELCOME TO THE TRANSLOC WEBSITE!

Transloc is an **open, collaborative** database documenting **1750 translocated populations** (to date) of **plants, animals, and lichens**, with the goal of improving conservation projects through knowledge sharing.

The scope of the database is as follows:

- Geographical scope: Western Palearctic - **including Europe and surrounding Mediterranean** regions
- Types of translocations: **conservation-driven translocations** and certain mitigation-driven translocations where population viability is a key objective
- **Data content:** taxonomic, contextual, organisational, geographical, and demographic information

Ascensao et al. in press Biol. Cons

Scenario: ● nac ● nfn ● nfs

Major challenges and hurdles

➡ **Data heterogeneity & missing information**

→ *Difficult to merge ecological, legal, and social datasets at European scale*

➡ **Balancing robustness vs. Accessibility**

→ *Need to produce outputs both scientifically solid and directly usable by practitioners.*

➡ **Time and coordination challenges**

→ *Multi-country delays affected deliverable timing but did not prevent main achievements*

➡ Yet... these constraints **reshaped the project** towards **stronger interdisciplinarity and cross-WP collaboration.**

Policy impacts

- ➔ **Supporting EU Nature Restoration Regulation implementation**
 - TRANSLOC provides operational evidence on species reintroductions, augmentations, and relocations contributing to restoration goals.
- ➔ **Informing national biodiversity and species strategies**
 - Evidence base for defining priorities and assessing feasibility, costs, and success
- ➔ **Bridging science, policy, and practice**
 - Structured dialogue via webinars, case studies, and practitioner engagement
 - Will continue through Biodiversa+ Knowledge Hub and open access TRANSLOC database

Conclusion

- Conservation translocations are powerful but challenging restoration tools.
- Combining ecological, evolutionary, and social data helps to explore scenarios addressing
- translocations relevance in changing environments.
- Data integration reveals trends, risks, and opportunities for translocation adaptive management.
- Standardization in translocation data collection and success assessment is crucial to improve their efficiency
- Dialogue among scientists, practitioners, and policymakers is essential to move from “*moving species*” to “*restoring systems*.”
